FOAM CLAY

DESCRIPTION:

Our foam clay starts out as a foamy putty like clay that stretches and blends beautifully into itself. Once the surface begins to dry, it can become difficult to smooth out lines, so we recommend using a SMALL amount of water. When your piece is finished, let it air dry, the larger the piece, the longer it will take (*).

Once fully cured, the foam clay dries to a high density foam that can be cut, sanded, hot formed and glued to your costume. Cured foam clay pieces do not need to be heat sealed, but we recommend priming before painting!

(*) We also recommend letting it cure for about 48 hours before painting, if your piece is large, the middle may not be fully cured yet. This is normal and you can primer and paint your piece before it has cured on the inside! But you should wait until your piece is fully cured before cutting and sanding through the surface layer.
